airline · slice()
airline · index of()

these should
be objects
then only we
can use dot operator
on them and call
methods

JS knows

array = {
  ↙ object
  slice : function
  splice : function
  sort : function
  ⋮
}

(arr) · slice()
(arr) splice()

"ABCD"   1234
  ⇓   ⇓
primitive   primitive

  ⇓
[aabcd] → string object · method()

★ WKT, string is a primitive, so how can you call methods
   on a primitive data type? here airline is a string but how
   methods are being executed?   (Autoboxing)

   ⇒ JS automatically converts string primitive to string object
      and then it executes methods, after execution it changes back
      string object to string primitive
